

Robots & the Future of Health and Healthcare

Mini Public Event

Oct 12, 2017 * 10am-4pm * The Cavonius Centre, 5 West Road, Cambridge CB3 9DP

Health care robots are set to transform how therapy is given to patients in the future. These are, for instance, robot exoskeletons, robot prosthetics or robot 'carers'. These new technologies have the potential to radically change how healthcare provision is given, and how patients are treated.

Will you be one of the groups affected by this new technology?

Does your work involve working with the senior populations?

Are you concerned about how the technology will affect you?

Are you a physiotherapist, nurse or other medical professional?

How will the NHS, clinics and the medical service provision be affected by robots?

Are you a maker of healthcare robots?

Are you a patient who has received physiotherapy for a stroke or other condition?

Is care something that can be delivered to people by robotic machines?

We are looking for participants to participate in this Mini Public Event.

Lunch and refreshments will be provided.

We invite anyone who is affected by any changes robots in healthcare may bring.

Are you concerned?

Or do you believe healthcare robots are a positive development?

We invite healthcare providers, healthcare recipients and the makers of new robotic technologies to participate.

We particularly welcome senior participants.

Please get in touch with any questions or if you wish to participate.
